

File service

If you want to search the files of server, you can activate file service .the operation as follows

1, “Option” ---“system setup”

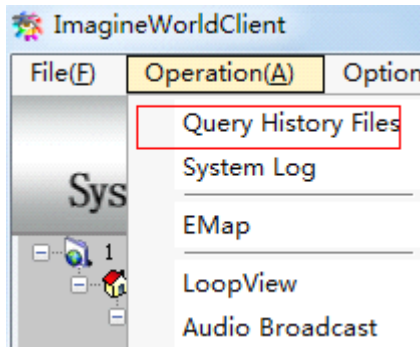

“File service” ---activate file service ,and set data port,

If the server is not in the LAN, you need to map the data port with the server.

2,"option"----"query history files"

Choose server query, and fill the server IP address, data port.

And then you can search the file of the server.
